Introduction to **Audio Content Analysis**

Module 3.1: Input Representation — Signals

alexander lerch

Georgia Tech | Center for Music Technology
College of Design

introduction

overview

corresponding textbook section

section 3.1

- **lecture content**
  - deterministic & periodic signals
  - Fourier Series
  - random signals
  - statistical signal description
  - digital signals

- **learning objectives**
  - name basic signal categories
  - discuss the nature of periodic signals with respect to harmonics
  - give a short description of meaning and use of the Fourier Series
  - list common descriptors for properties of a random signal

section 3.1

- **lecture content**
  - deterministic & periodic signals
  - Fourier Series
  - random signals
  - statistical signal description
  - digital signals

- **learning objectives**
  - name basic signal categories
  - discuss the nature of periodic signals with respect to harmonics
  - give a short description of meaning and use of the Fourier Series
  - list common descriptors for properties of a random signal

audio signals
signal categories

- **deterministic signals**:
  predictable: future shape of the signal can be known (example: sinusoidal)
- **random signals**:
  unpredictable: no knowledge can help to predict what is coming next (example: white noise)

"real-world" audio signals can be modeled as time-variant combination of

- (quasi-)periodic parts
- (quasi-)random parts

audio signals
signal categories

- **deterministic signals**:
  predictable: future shape of the signal can be known (example: sinusoidal)
- **random signals**:
  unpredictable: no knowledge can help to predict what is coming next (example: white noise)

- (quasi-)random parts

audio signals
periodic signals 1/5

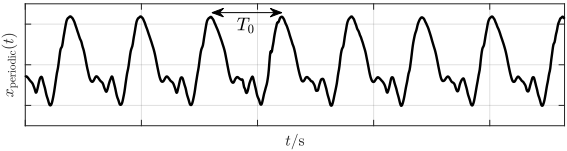
periodic signals: most prominent examples of deterministic signals

$$\begin{aligned} x(t) &= x(t + T_0) \\ f_0 &= \frac{1}{T_0} = \frac{\omega_0}{2\pi} \end{aligned}$$

audio signals
periodic signals 1/5

periodic signals: most prominent examples of deterministic signals

$$x(t) = x(t + T_0)$$
$$f_0 = \frac{1}{T_0} = \frac{\omega_0}{2\pi}$$



matlab source: plotPeriodic.m

audio signals
periodic signals 2/5

periodic signal $\Rightarrow$ representation in **Fourier series**[1]

$$x(t) = \sum_{k=-\infty}^{\infty} a_k e^{j\omega_0 kt}$$

- $\omega_0 = 2\pi \cdot f_0$
- $k\omega_0$: integer multiples of the lowest frequency
- $e^{j\omega_0 kt} = \cos(\omega_0 kt) + j\sin(\omega_0 kt)$
- a_k: Fourier coefficients — amplitude of each component

$$a_k = \frac{1}{T_0} \int_{-T_0/2}^{T_0/2} x(t) e^{-j\omega_0 kt}\, dt$$

[1] Jean-Baptiste Joseph Fourier, 1768–1830

audio signals

audio signals
periodic signals 2/5

periodic signal $\Rightarrow$ representation in **Fourier series**[1]

$$x(t) = \sum_{k=-\infty}^{\infty} a_k e^{\mathrm{j}\omega_0 k t}$$

- $\omega_0 = 2\pi \cdot f_0$
- $k\omega_0$: integer multiples of the lowest frequency
- $e^{\mathrm{j}\omega_0 k t} = \cos(\omega_0 k t) + \mathrm{j}\sin(\omega_0 k t)$
- a_k: Fourier coefficients — amplitude of each component

$$a_k = \frac{1}{T_0} \int_{-T_0/2}^{T_0/2} x(t) e^{-\mathrm{j}\omega_0 k t}\, dt$$

[1] Jean-Baptiste Joseph Fourier, 1768–1830

audio signals
periodic signals 3/5

Fourier series

- **every** periodic signal can be represented in a Fourier series
- a periodic signal **contains only** frequencies at integer multiples of the fundamental frequency f_0

- Fourier series can only be applied to periodic signals
- Fourier series is analytically elegant but only of limited practical use as the fundamental period has to be known

Fourier series

- **every** periodic signal can be represented in a Fourier series

- Fourier series can only be applied to periodic signals
- Fourier series is analytically elegant but only of limited practical use as the fundamental period has to be known

audio signals
periodic signals 4/5

reconstruction of periodic signals with limited number of sinusoidals:

$$\hat{x}(t) = \sum_{k=-\mathcal{K}}^{\mathcal{K}} a_k e^{\mathrm{j}\omega_0 k t}$$

audio signals
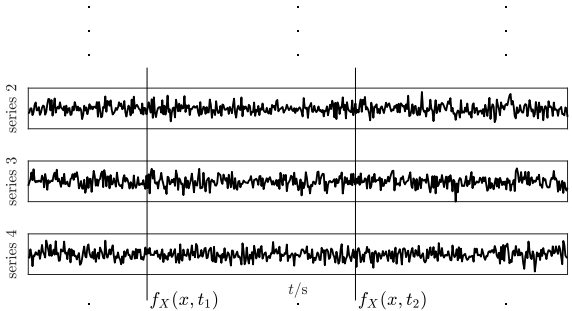
random process 1/2

random process: ensemble of random series



matlab source: plotRandomProcess.m

audio signals
random process 2/2

random process

- ensemble of random series
- each series represents a *sample* of the process
- the following value is *indetermined*, regardless of any amount of knowledge

- special case: **stationarity**
  statistical properties such as the mean are time invariant
- example: white noise

statistical signal description
probability density function

PDF $p_x(x)$

- x-axis: possible (amplitude) values
- y-axis: probability

$$p_x(x) \geq 0, \text{and}$$

$$\int_{-\infty}^{\infty} p_x(x)\,dx = 1$$

RFD—Relative Frequency Distribution (sample of PDF)

histogram of (amplitude) values

statistical signal description
probability density function

PDF $p_x(x)$

- x-axis: possible (amplitude) values
- y-axis: probability

$$p_x(x) \geq 0, \textit{and}$$

$$\int_{-\infty}^{\infty} p_x(x)\,dx = 1$$

RFD—Relative Frequency Distribution (sample of PDF)

histogram of (amplitude) values

statistical signal description
probability density function

histogram of (amplitude) values

statistical signal description

PDF examples

What is the PDF of the following prototype signals:

statistical signal description

PDF examples

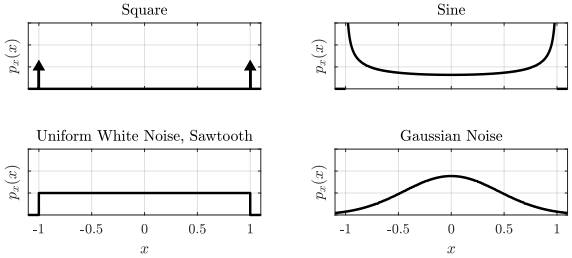
What is the PDF of the following prototype signals:

- square wave
- sawtooth wave
- sine wave
- white noise (uniform, gaussian)
- DC

statistical signal description

PDF examples

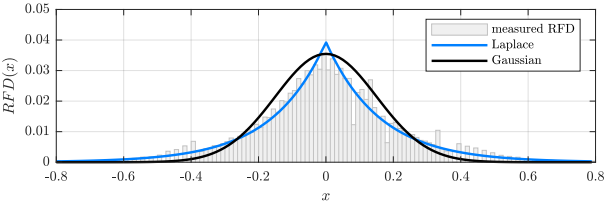
What is the PDF of the following prototype signals:



matlab source: plotPdfExamples.m

statistical signal description

RFD: real world signals



matlab source: plotRfd.m

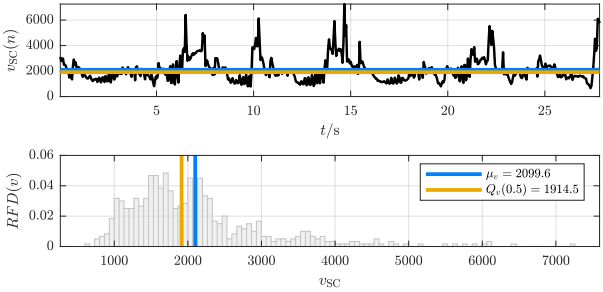
statistical signal description
arithmetic mean

- from time series x:

$$\mu_x(n) = \frac{1}{\mathcal{K}} \sum_{i=i_\mathrm{s}(n)}^{i_\mathrm{e}(n)} x(i)$$

- from distribution p_x:

$$\mu_x(n) = \sum_{x=-\infty}^{\infty} x \cdot p_x(x)$$



matlab source: plotArithmeticMean.m

statistical signal description

geometric & harmonic mean

- **geometric mean**

$$\begin{aligned} \mathrm{Mg}_v &= \sqrt[\mathcal{N}]{\prod_0^{\mathcal{N}-1} v(n)} \\ &= \exp\left(\frac{1}{\mathcal{N}} \sum_0^{\mathcal{N}-1} \log\left(v(n)\right)\right). \end{aligned}$$

- **harmonic mean**

$$\mathrm{Mh}_v = \frac{\mathcal{N}}{\sum_0^{\mathcal{N}-1} {}^1\!/_{v(n)}}.$$

statistical signal description

geometric & harmonic mean

- **geometric mean**

$$\begin{aligned} \mathrm{Mg}_v &= \sqrt[\mathcal{N}]{\prod_0^{\mathcal{N}-1} v(n)} \\ &= \exp\left(\frac{1}{\mathcal{N}} \sum_0^{\mathcal{N}-1} \log\left(v(n)\right)\right). \end{aligned}$$

- **harmonic mean**

$$\mathrm{Mh}_v = \frac{\mathcal{N}}{\sum_0^{\mathcal{N}-1} 1/v(n)}.$$

statistical signal description
variance & standard deviation

measure of *spread* of the signal around its mean

- **variance**
  - from signal block:

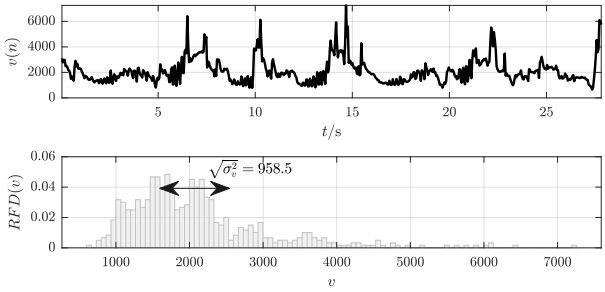
$$\sigma_x^2(n) = \frac{1}{\mathcal{K}} \sum_{i=i_\mathrm{s}(n)}^{i_\mathrm{e}(n)} \big(x(i) - \mu_x(n)\big)^2$$

  - from distribution:

$$\sigma_x^2(n) = \sum_{x=-\infty}^{\infty} \big(x - \mu_x\big)^2 \cdot p_x(x)$$

- **standard deviation**

$$\sigma_x(n) = \sqrt{\sigma_x^2(n)}$$



matlab source: plotStandardDeviation.m

statistical signal description

variance & standard deviation

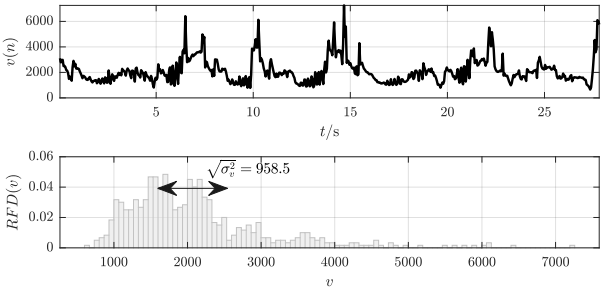
measure of *spread* of the signal around its mean

- **variance**
  - from signal block:

$$\sigma_x^2(n) = \frac{1}{\mathcal{K}} \sum_{i=i_s(n)}^{i_e(n)} \big(x(i) - \mu_x(n)\big)^2$$

  - from distribution:

$$\sigma_x^2(n) = \sum_{x=-\infty}^{\infty} \big(x - \mu_x\big)^2 \cdot p_x(x)$$



- **standard deviation**

$$\sigma_x(n) = \sqrt{\sigma_x^2(n)}$$

matlab source: plotStandardDeviation.m

statistical signal description
variance & standard deviation

measure of *spread* of the signal around its mean

- **variance**
  - from signal block:

$$\sigma_x^2(n) = \frac{1}{\mathcal{K}} \sum_{i=i_s(n)}^{i_e(n)} \left(x(i) - \mu_x(n)\right)^2$$

  - from distribution:

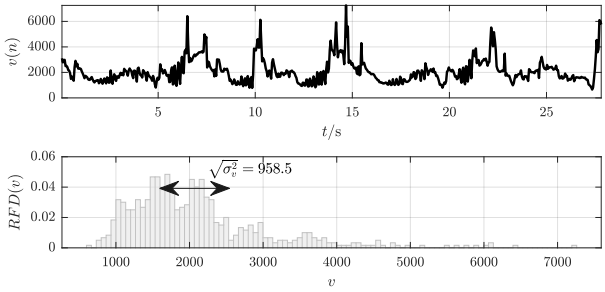
- **standard deviation**

$$\sigma_x(n) = \sqrt{\sigma_x^2(n)}$$



matlab source: plotStandardDeviation.m

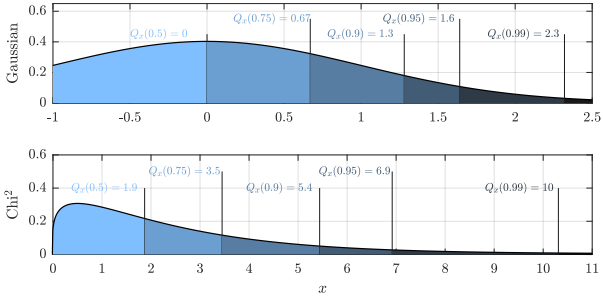
statistical signal description

quantiles & quantile ranges

dividing the PDF into (equal sized) subsets

$$Q_{\mathrm{X}}(c_p) = \operatorname{argmin}\left(F_{\mathrm{X}}(x) \leq c_p\right)$$

$$\textit{with} \quad F_{\mathrm{X}}(x) = \int_{-\infty}^{x} p_{\mathrm{X}}(y)\, dy$$



matlab source: plotPdfQuantiles.m

statistical signal description
quantile examples

- **median**

$$Q_{\mathrm{X}}(0.5) = \operatorname{argmin}\left(F_{\mathrm{X}}(x) \leq 0.5\right)$$

- **quartiles**: $Q_{\mathrm{X}}(0.25)$, $Q_{\mathrm{X}}(0.5)$, and $Q_{\mathrm{X}}x(0.75)$

- **quantile range**, e.g.

$$\Delta Q_{\mathrm{X}}(0.9) = Q_{\mathrm{X}}(0.95) - Q_{\mathrm{X}}(0.05)$$

summary
lecture content

- signals can be categorized into **deterministic and random signals**
  - deterministic signal can be described in a mathematical function
  - random processes can only be described by their general properties
- **periodic signals**
  - periodic signals are probably the most music-related deterministic signal
  - any periodic (pitched) signal is a sum of weighted sinusoidals
  - frequencies *only* at the fundamental frequency and integer multiples
- **random** signals
  - noise, unpredictable
- **real-world** signals
  - can be seen as a time-varying mixture of these two signal categories
- **statistical features**
  - summarize technical signal characteristics in few numerical values
  - may be used on a time domain, frequency domain, or feature domain signal
